Dissipation and the Foundations of Statistical Thermodynamics

Chapter 1. Introduction

Chapter 2. Introduction to time reversible, thermostatted dynamical systems and statistical mechanical ensembles

§2.1 Time reversibility in dynamical systems
§2.2 Introduction to time reversible, thermostatted dynamical systems
§2.3 Example: Homogeneously thermostatted SLLOD equations for planar Couette flow
§2.4 Phase Continuity Equation
§2.5 Lyapunov Instability and statistical mechanics
§2.6 Entropy in deterministic nonequilibrium states
§2.7 Historical Aside: Coincidences?

Chapter 3. The Evans-Searles Fluctuation Theorem

§3.1 The Transient Fluctuation Theorem
§3.2 Second Law Inequality
§3.3 Nonequilibrium Partition Identity
§3.4 Integrated Fluctuation Theorem
§3.5 Functional Transient Fluctuation Theorem
§3.6 The Covariant Dissipation Function
§3.7 The definition of Equilibrium
§3.8 Conclusion

Chapter 4. Dissipation Theorem

§4.1 Derivation of the Dissipation Theorem
§4.2 Equilibrium distributions are preserved by their associated dynamics
§4.3 Broad characterization of nonequilibrium systems: driven Equilibrating and T-mixing systems
§4.4 Green-Kubo Relations
§4.5 Examples

Chapter 5. Equilibrium Relaxation Theorems

§5.1 Introduction
§5.2 Relaxation towards microcanonical equilibrium: the ergodic theory approach
§5.3 Relaxation of autonomous Hamiltonian systems under T-mixing
§5.4 Thermal relaxation to equilibrium: the canonical ensemble
§5.5 Relaxation to quasi-equilibrium for nonergodic systems
§5.6 Aside: the thermodynamic connection
§A5 Appendix: the computation of the phase space expansion factor

Chapter 6. Nonequilibrium steady states

§6.1 The physically ergodic nonequilibrium steady state
§6.2 Entropy and entropy production in nonequilibrium steady states
§6.3 Dissipation in nonequilibrium steady states (NESSs)
§6.4 For T-mixing systems the nonequilibrium steady state is independent of the initial distribution
§6.5 In the linear response regime, the dissipation is minimal with respect to variations of the initial distribution
§6.6 Sum rules for dissipation in steady states
§6.7 Positivity of nonlinear transport coefficients
§6.8 Linear constitutive relations for T-mixing canonical systems
§6.9 Gaussian statistics for T-mixing NESS
§6.10 The Nonequilibrium Steady State Fluctuation Relation
§6.11 Gallavotti-Cohen Steady State Fluctuation Theorem
§6.12 Summary
§A6 Appendix

Chapter 7. Applications of the Fluctuation, dissipation and relaxation theorems

§7.1 Introduction
§7.1 Proof of the Zeroth "Law" of thermodynamics
§7.3 Further properties of dissipation
§7.4 Heat flow
§7.5 Dissipation theorem for a temperature quench
§7.6 Colour relaxation in Hamiltonian systems
§7.7 Instantaneous Fluctuation relations
§7.8 Experimental demonstrations

Chapter 8. Nonequilibrium work relations and equilibrium thermodynamics

§8.1 Generalized Crooks fluctuation theorem (GCFT)
§8.2 Generalized Jarzynski equality
§8.3 Minimum average generalized work
§8.4 Nonequilibrium work relations for thermal processes
§8.5 Clausius' inequality and thermodynamic temperature
§8.6 Purely dissipative generalized work
§8.7 Crooks fluctuation theorem and Jarzynski equality
§8.8 Entropy revisited
§8.9 For thermostatted systems the Helmholtz free energy is a constant of the motion
§8.10 Experimental demonstrations of Crooks and Jarzynski relations

Chapter 9. Causality

§9.1 Introduction
§9.2 Causal and anticausal constitutive relations
§9.3 Green-Kubo relations for causal and anticausal response functions
§9.4 Example: the Maxwell model of viscosity
§9.5 Phase space trajectories for ergostatted shear flow
§9.6 Simulation results
§9.7 Summary and conclusion
